

# Aluminium coil packaging requirements

Eye-to-side/sky packaging refers to where the coils' center (the "eye") points.

## GENERAL REQUIREMENTS

- The pallet must be suitable to be handled by forklift (minimum 8cm space from pallet to floor).
- The pallet must not be longer/wider than the material to allow safe storage.
- Material should be packed strapped with steel/PE band to avoid slipping and allow safe handling.
- Material surface shall be protected against humidity (e.g. with foil), edges preferably protected.
- Please consider the positive/negative examples on page two.

## Packaging outside dimensions

# Good & less good examples

Insufficient assembly of the pallet and inclined beams the coil is resting in.

The coil mold is not protected with cardboard or foil, resulting in surface damage at unloading.

These wooden feet are not high enough (7cm). 8cm minimum height is needed

These wooden feet are higher than 8cm (very good for forklift handling) and are not wider than the material.

The coil is protected with foil and strapped with PE band.
